Patent Application
Docket No. 20661-801USD1

In the Claims

- ĺ 1. (Amended) A resistor having a resistance that can be adjusted by current being passed 2 there through and which is formed as part of a semiconductor device comprising: a polycrystalline silicon resistor formed of and on a layer, wherein said polysilicon 3 resistor is formed using a doping wherein said doping has a concentration of from ~6x10¹⁹ cm⁻³ 4 to $\sim [3.75] 1 \times 10^{20}$ cm⁻³ and wherein said polycrystalline silicon resistor has at least a first and 5 second order temperature coefficient, wherein the sign of said first and second order temperature 6 7 coefficients are opposite each other, and wherein said resistor resistance is electronically trimmable within a range from 60% to 8 9 30 % of original value and further wherein said [doping] dopant consist essentially of Phosphorus. [produces a fine 10 . 11 and increased grain boundary density] grain size an
 - 2. (Previously Amended) A resistor having a resistance that can be adjusted by current being passed there through and which is formed as part of a semiconductor device comprising:

 a polycrystalline silicon resistor formed of on a layer, wherein said polysilicon resistor is formed using a doping wherein said doping has a concentration of less than ~3.75×10²⁰ cm⁻³ and wherein said polycrystalline silicon resistor has at least a first and second order temperature coefficient, wherein the sign of said first and second order temperature coefficients are opposite

each other; and

7

8	wherein said resistor resistance is electronically trimmed trimmable within a range from
9	60% to 30 % of original value and
10	further wherein said dopant consist essentially of Phosphorus. [doping produces a fine
11	grain size and an increased grain boundary density].
	3 - 10. (Cancelled)
1	11. (Amended) A resistor having a resistance that can be adjusted by current being
2	passed there through and which is formed as part of a semiconductor device comprising:
3	a polycrystalline silicon resistor formed of on a layer, wherein said polysilicon resistor is
4	formed using a doping wherein said doping has a concentration of greater than ~6x10 ¹⁹ cm ⁻³ and
5	wherein said polycrystalline silicon resistor has at least a first and second order temperature
6	coefficient, wherein the sign of said first and second order temperature coefficients are opposite
7	each other; and
8	wherein said resistor resistance is electronically trimmed trimmable and
9	further wherein said dopant consist essentially of Phosphorus. [doping produces a fine
10	grain size and an increased grain boundary density]
11	
1	12. (Amended) A resistor having a resistance that can be adjusted by current being
2	passed there through and which is formed as part of a semiconductor device comprising:
3	a polycrystalline silicon resistor formed of on a layer, wherein said polysilicon resistor is
4	formed using a late implant doping technique and wherein said polycrystalline silicon resistor

density

.]

5	has at least a first and second order temperature coefficient, wherein the sign of said first and
6	second order temperature coefficients are opposite each other; and
7	wherein said resistor resistance is electronically trimmed trimmable and
8	further wherein said dopant consist essentially of Phosphorus. [doping produces a fine
